Naïve Bayes Classification

Stu Field

1 Bayes' Rule

$$P(\theta|Data) = \frac{P(Data|\theta) \times P(\theta)}{P(Data)} \tag{1}$$

2 Bayes Classifier

odds ratio =
$$\frac{P(x = c_1|Data)}{P(x = c_2|Data)} = \frac{P(Data|x = c_1) \cdot P(x = c_1)}{P(Data|x = c_2) \cdot P(x = c_2)}$$
$$log(odds) = log\left(\frac{P(Data|x = c_1)}{P(Data|x = c_2)} \cdot \frac{P(x = c_1)}{P(x = c_2)}\right)$$
$$log(odds) = log\left(\frac{P(Data|x = c_1)}{P(Data|x = c_2)}\right) + log\left(\frac{P(x = c_1)}{P(x = c_2)}\right)$$

3 Bayes In Practice

$$\frac{P(Data|x=c_1)}{P(Data|x=c_2)} = \frac{P(A_1 = a_1, A_2 = a_2, \dots, A_n = a_n | x = c_1)}{P(A_1 = a_1, A_2 = a_2, \dots, A_n = a_n | x = c_2)}$$

$$= \frac{P(A_1 = a_1 | x = c_1) P(A_1 = a_1 | x = c_1), \dots, P(A_n = a_n | x = c_1)}{P(A_1 = a_1 | x = c_2) P(A_1 = a_1 | x = c_2), \dots, P(A_n = a_n | x = c_2)}$$

$$log\left(\frac{P(Data|x=c_1)}{P(Data|x=c_2)}\right) = log\left(\frac{P(A_1=a_1|x=c_1)}{P(A_1=a_1|x=c_2)}\right) + \\ log\left(\frac{P(A_2=a_2|x=c_1)}{P(A_2=a_2|x=c_2)}\right) + \dots + log\left(\frac{P(A_n=a_n|x=c_1)}{P(A_n=a_n|x=c_2)}\right)$$

Therefore, putting together gives,

$$log(odds) = log\left(\frac{P(A_1 = a_1|x = c_1)}{P(A_1 = a_1|x = c_2)}\right) + log\left(\frac{P(A_2 = a_2|x = c_1)}{P(A_2 = a_2|x = c_2)}\right) + \dots + log\left(\frac{P(A_n = a_n|x = c_1)}{P(A_n = a_n|x = c_2)}\right) + log\left(\frac{P(x = c_1)}{P(x = c_2)}\right)$$

where,

$$log\left(\frac{P(x=c_1)}{P(x=c_2)}\right)$$

is the Bayesian prior and is typically set to zero (unless known previously).

3.1 Calculation of the Terms

Bayes Odds Ratio Calculation Control 0.25 0.20 log2(odds) = -3.09150.15 0.10 mu = 10 mu = 17sd = 2.0sd = 1.50.05 0.00 10 20 15 25 Measurement Values

Figure 1: PDFs of the a theoretical control population (blue) and disease population (red) for a single analyte. The population estimates are shown and the green line represents a sample value of 14. The odds ratio is the probability of control given the sample value over the probability of disease given the sample (dnorm(14, 10, 1.5) / dnorm(14, 17, 2)).
